Specifications

Goal:

The main objective of the project is to show the load used on the different GPUs used for machine learning.

Content :

The site must contain on a single page:

- The different computers used or not.
- For each computer, you need its visible IP address.
- Differentiate between those that are not used and those that are used.
- The percentage of GPU usage should be visible for each PC in graphical or non-graphical form (the three most used if the computer has more)
- When we click on a computer, we should be able to see in detail the information of each GPU (temperature, usage, max capacity, name, ...).
- If a GPU reaches > 90%, notify it with a notification. (Show maximum 3 notifications at the same time).
